# Evaluation of microbial health risks associated with the reuse of human urine

Caroline Schönning

Swedish Institute for Infectious Disease Control (SMI)  
Department of Water and Environmental Microbiology

Royal Institute of Technology (KTH)  
Department of Biotechnology, Applied Microbiology

Stockholm 2001

**EC 238**

1.1 History	1
1.2 Sustainable sanitation systems	1
1.3 Nutrient content and volume of domestic wastewater	1
1.4 Wastewater systems that divert urine and faeces	2
1.5 Characteristics of diverted human urine	2
2. OBJECTIVES AND SCOPE OF THE PRESENT INVESTIGATION	4
3. PATHOGENIC MICROORGANISMS IN SANITARY SYSTEMS	5
3.1 Transmission routes	5
3.2 Pathogenic microorganisms in urine	6
3.3 Pathogenic microorganisms in faeces	6
3.4 Transmission of pathogens in reuse systems	7
4. FAECAL CONTAMINATION	8
4.1 Analysis of indicator bacteria to determine faecal contamination	8
4.2 Analysis of faecal sterols to determine faecal contamination	10
4.3 Discussion	11
5. PERSISTENCE OF MICROORGANISMS IN URINE	12
5.1 Survival of microorganisms in the environment	12
5.2 Relative persistence of enteric microorganisms	13
5.3 Survival of bacteria	14
5.4 Survival of protozoa	15
5.5 Survival of viruses	16
5.6 Discussion	18
6. MICROBIAL RISK ASSESSMENT OF URINE-DIVERTING SYSTEMS	19
6.1 Quantitative Microbial Risk Assessment	19
6.2 Exposure scenarios	19
6.3 Quantitative risks	20
6.4 Discussion	22
6.5 Acceptable risk and risk minimisation	23
7. GUIDELINES FOR THE REUSE OF HUMAN URINE	24
8. GENERAL DISCUSSION	26
8.1 Health risks	26
8.2 The present situation in Sweden	28
8.3 The present situation in developing countries	29
9. CONCLUSIONS	30
10. REFERENCES	32
